

All I ever needed to know  
I learned from grepping  
**`/usr/src/linux/`**

```
/* Watch for overflows 🐧 Seeks are not allowed on  
pipes. 🐧 Need to clean after the sucker 🐧 Clear the  
capabilities if we switch to a non-root user 🐧 this  
should never be reached, but safety first... 🐧 source  
must exist 🐧 Gcc optimizes away "strlen(x)" for  
constant x 🐧 If device is running, close it first. 🐧 This is  
"wrong" - talk to Al Viro 🐧 Rock ridge never appears on  
a High Sierra disk 🐧 Found nothing?!?! Either we hang  
forever, or we panic. 🐧 Finalize the task. 🐧 Ensure  
we've flushed out any previous writes 🐧 check that the  
match is indeed a match 🐧 Never send packets back to  
the socket 🐧 OK, This is the point of no return */
```
